# Kamper Aid™

**PROBLEM** Mounted stabilizer jacks can scrape the ground during travel causing damage to the jack and to your travel trailer.

**SOLUTION** By attaching Kamper Aid to your jack mount, it simply swings the jack up and away, temporarily locking it in place resulting in extra clearance and smoother traveling.

Travel trailers are built low to the ground for stability and aerodynamics, but when parked they require stabilizer jacks for leveling which can scrape and damage the jack and trailer when traveling in low ground clearance situations. With the Kamper Aid adapter, the stabilizer jack easily swings up and out of the way providing increased ground clearance, less costly jack replacements, less damage to your trailer, and a smoother, more enjoyable travel experience.
